PANTHEON™ is an integrated ERP system designed to cover most aspects of running a company. Pantheon was developed by a Slovenian company DataLab, which is focused on developing quality business applications. PANTHEON™ ERP is especially designed for SMEs, which is not the limitation to be used in larger organizations. So far, around 2400 Slovenian companies and around 1400 companies abroad have implemented Pantheon. Customer satisfaction surveys have shown that 90% of users recommend Pantheon. Pantheon is available in many versions. It depends on the type of company, which version is to be implemented. There are three ways, by which Pantheon can be bought and used. You can either buy a license for Pantheon, rent the license or order the program and pay monthly subscription fees. The amount of payment is determined by the amount of Licenses you order. The number of licenses depends on the number of users in one company which need to use Pantheon simultaneously; Pantheon can be accessed multiple times, the only limitation is the number of users we can access Pantheon simultaneously. This is determined by the number of Licenses ordered.

In our project we had a task to test PANTHEON™ (version 5.0) and carry out a selling process with it. This was done in the following steps:

Step 1. When we first ran Pantheon, the program offered a form, in which we needed to identify our company.

Step 2. After we identified our company, we had to identify key role-players in our selling process. We created and identified a new Buyer and a new Product. We used an existing Supplier.

Step 3. After we identified all the necessary role-players, we began creating a purchase order from our new buyer.

Step 4: As we noticed that the goods are not in the stock, we needed to create a purchase order to our supplier in order to receive the good.

Step 5: After the goods are received to the stock, the purchase order was confirmed by our company.

Step 6: The next step is to deliver goods and bills to the buyer.

Step 7: When we receive the determined payment from our buyer, the selling process ends.

At the end of our project we agreed that PANTHEON™ ERP is a very powerful and useful program and quite cheap in comparison with other ERP systems, like SAP or Navision. The
PANTHEON™ ERP offers various ways of user's Help Desk (via online support, discussion forums and also video-clips). Initial users might meet with some problems before mastering the program. Therefore it is recommended to use training courses available at the Datalab Company or its partners.
